

RE: Microplastics in sachet tea bags

October 2019

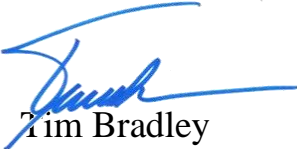

To Whom it may concern,

A recent study that indicates some of our competitors' premium sachet teabags made from petrochemical-derived PET plastic or nylon can leave billions of microplastic particles in their tea during the steeping process.

***Teatulia pyramid teabags are made from plant starch***, not any of the materials examined in the recent study. Further, Teatulia's manufacturing process does not use any adhesives to seal the tea bags; they are sealed ultrasonically which is faster and cleaner.

This results in a product that is free of any petrochemical-derived materials that are causing alarm. The teabags Teatulia uses are upheld by food safety standards of the FDA, EU and Japan.

We are thankful that this issue is gaining the visibility it has, for the sake of our consumers' health *and* the environment. If you have any further questions or comments, we are always here to help. Please call us at 1-888-860-3233 or email [info@teatulia.com](mailto:info@teatulia.com).
